

Effects of Agricultural Policies on Human Nutrition and Obesity

Julian Alston, ARE/UCD¹; John Beghin, CARD/ISU²; Helen Jensen, CARD/ISU; Lucia Kaiser, NUT/UCD³; Daniel Sumner, ARE/UCD, AIC⁴; Stephen Vosti, ARE/UCD, CNRPA⁵

Overview

Issue: Obesity is on the rise with high social costs
Do federal agricultural policies contribute?

Study Objectives:

Quantify the nature and extent of the effects of selected agricultural policies on human nutrition and obesity

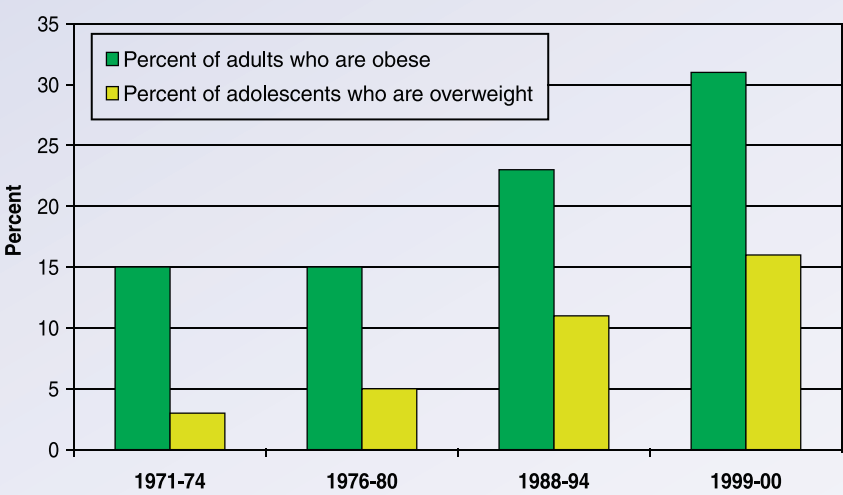

Agricultural Policies of Primary Interest:

- commodity price & income supports
- trade policies
- public agricultural R&D
- food assistance programs (WIC, Food Stamps)

Some Proposed Policy Solutions:

Eliminate commodity programs, tax fat and sweet foods, regulate food industry, change food programs

Obesity has risen rapidly since the mid-1970s

USDA program funding

USDA Programs	Expenditure in 2004 billions of dollars	Percent of Total percent
Food, Nutrition, and Consumer Services	45.4	40.2
Farm Service Agency (mainly farm commodity programs)	27.4	24.3
Research, Education and Economics (mainly agricultural R&D)	2.5	2.2

Issues in Today's Markets

Increasing “disconnect” between commodity prices and food prices

Apparent increases in the prices of some fresh fruits and vegetables. . .

. . . may be due to changes in availability, seasonal availability or new product characteristics

Monthly Retail Strawberry Prices, deflated (1983=100) and seasonally adjusted

Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
1980				0.76	0.70	0.76						
1981		0.94	0.73	0.68	0.74	0.81

2005	1.71	1.25	1.00	0.80	0.81	0.83	0.85	0.95	1.13	1.15	1.17	1.38

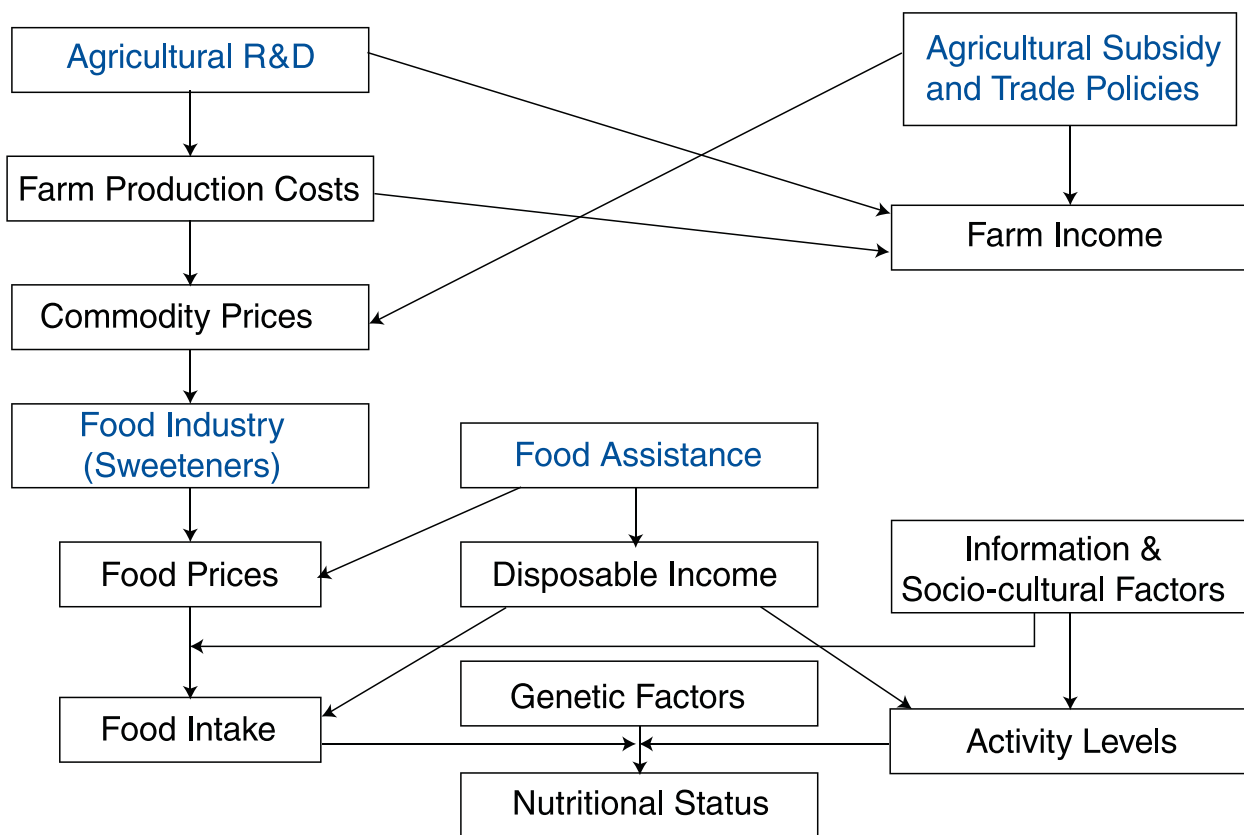

Conceptual Framework

Agricultural policies affect food consumption

- direct effect on prices (up and down)
- indirect effects on food characteristics and composition

Food consumption and choices affect nutritional outcomes and obesity

- confounded by changes in income and food preferences
- affected by food assistance programs
- confounded by changes in the food industry and technology

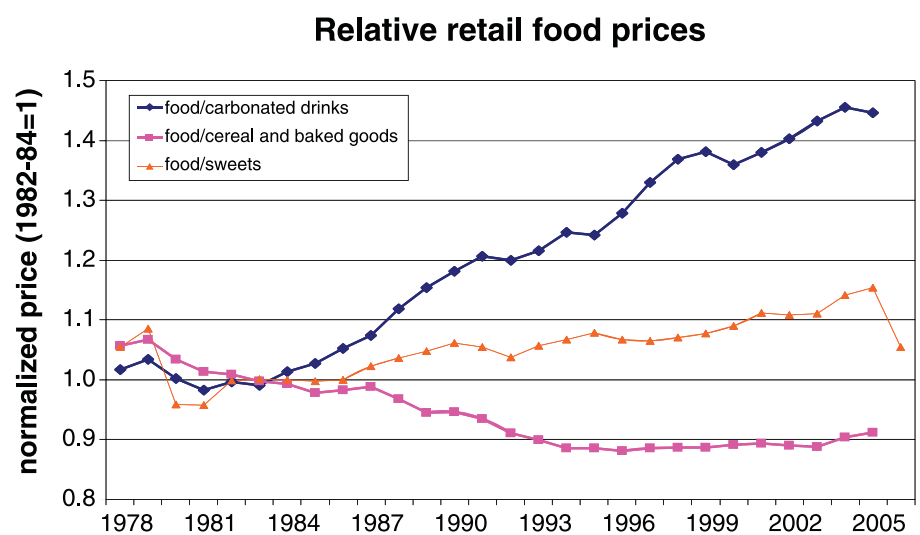

Case Study: Sweeteners

Per capita consumption of all sweeteners has increased and peaked in 1999. Today the composition of sweeteners consumed includes less sugar and more high fructose corn sweetener (HFCS).

Aggregate food prices have risen much faster than the price of carbonated drinks, slightly more than the price of sweets and have fallen relative to the price of baked goods.

Research Program

- Review changes in food consumption patterns, food prices, agricultural commodity prices, and food & agricultural policies
- Analyze the effects of alternative farm subsidy policies and agricultural R&D policies on commodity prices
- Analyze the consequences of alternative agricultural policies for food prices & consumption patterns, and their implications for nutrition and obesity
- Case study: Role of corn and sugar policies on prices and consumption of sugar and other caloric sweeteners
- Case study: WIC program in the Sacramento, CA area, with special focus on Latina mothers and their toddlers
- Evaluate the effects of possible changes to food assistance programs on diet quality and obesity

Findings and Policy Implications

Agricultural Policy & Commodity Prices

- Commodity support programs have small, though varied, effects on commodity prices
- Past publicly sponsored agricultural research has led to productivity increases and commodity price declines

Commodity Prices & Food Prices

- Increasing “disconnect” between commodity and food prices

Food Prices & Caloric Intake

- Consumer responses to food price changes are generally small
- Food industries affect consumption through choice of food ingredient use, food preparation technologies and portion sizes

Can Agricultural Policy Help Reduce Obesity?

- Eliminating federal commodity subsidy policies or reversing agricultural policies pursued over the past 40 years would have little effect on today's nutritional outcomes and obesity.
- Some opportunities exist for change. Increased support to improve the yields, quality, and availability of fresh fruits and vegetables will widen consumer choices and enhance health benefits from consumption

Food Assistance Programs

- Restrictions on the use of Food Stamps to purchase ‘unhealthy’ foods would be difficult to implement and monitor and will reduce program participation. Moreover, while diet quality may improve for participants, changes in food prices may induce reductions in diet quality among eligible non-participants.

Results: Commodity & Food Prices

Farm prices for commodities decline

Prices Received Deflated with Prices Paid (commodities, services, interest, taxes, wages) (1977=100)

Mixed trends for fruits and vegetables prices

Prices Received by Farmers for Selected Fruits and Vegetables (Deflated, 1977=100)

General decline in real retail food prices

Acknowledgments

This project was supported by the National Research Initiative of the Cooperative State Research, Education and Extension Service, USDA, Grant #2006-55215-16720, the Food Assistance and Nutrition Research Program (FANRP) of USDA's Economic Research Service and the Giannini Foundation.

We acknowledge the collaborative efforts of Aslihan Arslan, Jim Barrett, Virginia Chaidze, Abigail Kish, Conner Mullally, Micki Stewart, Marilyn Townsend and Amani Eloheid.
