ABSTRACT

This report presents aggregate data on agricultural inputs and outputs for 18 developing countries: Argentina, Brazil, Chile, Colombia, Dominican Republic, Egypt, Ghana, Ivory Coast, Malaysia, Morocco, Pakistan, Philippines, Portugal, South Korea, Sri Lanka, Thailand, Turkey, and Zambia for 1961-88.

AGGREGATE AGRICULTURAL INPUTS AND OUTPUTS IN DEVELOPING COUNTRIES: A DATA SET

This publication describes and presents a time-series data set of agricultural inputs and outputs for 18 developing countries: Argentina, Brazil, Chile, Colombia, Dominican Republic, Egypt, Ghana, Ivory Coast, Malaysia, Morocco, Pakistan, Philippines, Portugal, South Korea, Sri Lanka, Thailand, Turkey, and Zambia. The data are compiled in comparable units across countries, using, for example, international dollars for the production variable and scientist man-years (SMY) for research personnel. The sources of the original data were international agencies such as the World Bank (WB), the United Nations (UN), and the International Labor Organization (ILO), supplemented by individual government and private agencies. In order to have a complete time-series for each variable, missing observations were generated by extrapolation, interpolation, or regression analysis on related variables.

Production

The four production variables are the values of total crop production (*CPN*), total livestock production (*LPN*), total agricultural production (*TPN*), and an index of total agricultural production (*ITPN*). The data for these four variables were collected from *World Agricultural Trends and Indicators, 1970-1988*, a tape distributed by the Economic Research Service of the USDA.

The first three variables are defined as total current output values of crop, livestock, and total agricultural output in millions of 1979-81 international dollars. An international dollar is an expression for "international commodity prices" derived from the Geary-Khamis formula for the agricultural sector. These "prices" were developed by FAO to avoid the use of exchange rates (ERS 1989). The method assigns a single world price to each commodity; that is, one ton of rice has the same price in whatever country rice is produced. Each price represents the 1979-81 actual average export price in the principal exporting country for heavily traded commodities, or the actual average wholesale price in the largest free market producing country for the other commodities (ERS 1989).

The agricultural output variable includes food production, industrial oilseeds, tobacco, fibers (vegetables and animal), and rubber, excluding all intermediate products (agricultural inputs of

agricultural origin). The index of total agricultural production is a Laspeyres-type index that shows the level of aggregate agricultural output for each year relative to the base period 1979-81 (FAO).

Prices

In this section, there are four price variables: output price index (P), agricultural wages ($AWAGES$), the index of agricultural wages ($WAGEI$) and fertilizer price index (I). The commodities aggregated for each country and different methods were used to complete missing values.

Output Price Index

The output price index (P) represents domestic prices relative to world prices all evaluated at official dollar exchange rates. The commodities aggregated for each country represent 60 to 80 percent of total value of production for that country. The commodities included are listed here by country.

Argentina	: beef, corn, sorghum, soybeans, sunflower, and wheat.
Brazil	: corn, cotton, rice, soybeans, and wheat.
Chile	: apples, beef, grapes, milk, and wheat.
Colombia	: coffee, cotton, rice, and wheat.
Dominican Republic	: coffee, rice, and sugar.
Egypt	: corn, cotton, rice, sugar, and wheat.
Ghana	: cocoa, corn, and rice.
Ivory Coast	: cocoa, corn, and rice.
Malaysia	: palm oil, rice, and rubber.
Morocco	: barley, sugar, and wheat.
Philippines	: copra, corn, rice, and sugar.
Portugal	: beef, corn, milk, potatoes, rice, sheep, tomatoes, wheat, and wine.
South Korea	: barley, beef, pork, rice, and soybeans.
Sri Lanka	: rice, rubber, and tea.
Thailand	: corn, rice, rubber, and sugar.
Turkey	: barley, cotton, hazelnuts, sheep, sugar, tobacco, and wheat.
Zambia	: corn, cotton, and tobacco.

Original price data on domestic currency, as well as official exchange rates, were obtained from country reports from the IBRD project # 673-64. Let R be the official exchange rate, q be the quantity produced of each commodity, p be the domestic price in domestic currency, ρ be the dollar price, and s be the share of the commodity in the value of production and let the subscript i represent the commodity, j represent the country, and t represent the year. Dollar prices were calculated as

$$\rho_{ijt} = R_j \cdot p_{ijt} . \quad (1)$$

The world average price of commodity i across all years was calculated as

$$\rho_{i..} = \frac{\sum_j \sum_t \rho_{ijt} \cdot q_{ijt}}{\sum_j \sum_t q_{ijt}} . \quad (2)$$

The world average share of each commodity was calculated as

$$s_{i..} = \frac{\sum_j \sum_t \rho_{ijt} \cdot q_{ijt}}{\sum_i \sum_j \sum_t \rho_{ijt} \cdot q_{ijt}} . \quad (3)$$

The base period (1980) world average price is

$$\rho_{i..0} = \frac{\sum_j \rho_{ijo} \cdot q_{ijo}}{\sum_j q_{ijo}} = 278.54 , \quad (4)$$

and the base period world average share is

$$s_{i..0} = \frac{\sum_j \rho_{ijo} \cdot q_{ijo}}{\sum_i \sum_j \rho_{ijo} \cdot q_{ijo}} , \quad (5)$$

where 0 refers to the base year of 1980.

The output price index for country j in year t was obtained as

$$I_j = \frac{\prod_i p_{ijt}^{s_{it}} \cdot \prod_i \rho_{ijo}^{s_{io}}}{\prod_i \rho_{i..} \cdot \prod_i \rho_{i..0}} . \quad (6)$$

Agricultural Wages

The agricultural wages (*AWAGES*) are defined as monthly wages in agriculture measured in current domestic currency. These data were collected either from the International Labor Office, *Yearbook of Labor Statistics* (various issues), *FAO Production Yearbook* (various issues), or country-specific sources listed here.

Argentina : Domenech, R. A., D. F. Cavallo, and Y. Mundlak (1986).

Brazil : Brandao, A. S. P. and J. L. Carvalho (1987).

Dominican Republic : Greene, D. D. and T. L. Roe (1987).

Egypt : Dethier, J. J. (1988).

Ivory Coast : Atsain, A., A. M'Bet and S. Ehouman (1985).

The following conversion factors from Hayami and Ruttan (1985) were used to convert wages into a common time unit: 1 day = 8 hours, 1 week = 5 days, and 1 month = 4.3 weeks. In addition, if wage data were available for male, female, and total employment, the total value was used. If only male and female wages were available, the proportion of males and females in the agricultural sector labor force was used as weights. If data were classified into skilled and nonskilled labor, the nonskilled wage rates were used.

Missing observations were obtained with regressions on the following variables: Nominal Nonagricultural Wages (*NNAW*), Real Agricultural Wages (*RAW*), Consumer Price Index (*CPI*), Average Annual Growth Rate of CPI (*AGRCPI*), Time (*T*), or Year (*Y*). These variables were obtained from the *World Tables 1987*.

Brazil

For the whole series:

$$\underline{\text{RAW}} = -55380.87 + 28.47 \text{ Y} \quad R^2 = 84.51 \\ (63.58) \quad (3.15) \quad n = 17$$

where *RAW* is Real Agricultural Wages.

This series is multiplied by the *CPI* (1977 = 100) to obtain the estimates of nominal agricultural wages.

Colombia

For 1970 < year < 1975:

$$\underline{\text{AWAGES}} = -113.703 + 39.8394 \text{ NNAW} \quad R^2 = 99.69 \\ (79.59) \quad (0.7786) \quad n = 10$$

Dominican Republic

For year > 1978:

$$\text{AWAGES} = 25.8467 + 0.4149 \text{ NNAW} \quad R^2 = 67.03$$

$$(5.7857) \quad (0.0877) \quad n = 13$$

For year < 1966:

$$\text{AWAGES} = 46.3963 + 0.0043 T \quad R^2 = 86.31$$

$$(6.2299) \quad (0.0004) \quad n = 20$$

where T is time.

Egypt

For 1965 < year < 1969:

$$\text{AWAGES} = -4.7395 + 0.3671 \text{ NNAW} \quad R^2 = 98.87$$

$$(1.3186) \quad (0.0119) \quad n = 13$$

For year < 1965:

$$\text{AWAGES} = (1 - \text{AGRCPPI}) \times \text{AWAGES}(+1).$$

Ghana

For years 1973, 1974 and 1983:

$$\text{AWAGES} = -5.7679 + 3.2947 \text{ NNAW} \quad R^2 = 98.49$$

$$(22.6118) \quad (0.1100) \quad n = 15$$

For year > 1983:

$$\text{AWAGES} = (1 + \text{AGRCPPI}) \times \text{AWAGES}(-1).$$

Ivory Coast

For year > 1982:

$$\text{AWAGES} = -14411.6471 + 7.4099 Y \quad R^2 = 77.48$$

$$(26.5788) \quad (0.8932) \quad n = 22$$

where Y is year.

Malaysia

For year < 1969 and year > 1979:

$$\text{AWAGES} = -1.6899 + 1.6226 \text{ NNAW} \quad R^2 = 93.61$$

$$(7.8606) \quad (0.1413) \quad n = 11$$

Morocco

For 1972:

$$\text{AWAGES} = -18.0343 + 2.5911 \text{ NNAW} \quad R^2 = 79.36$$

$$(12.7763) \quad (0.4995) \quad n = 9$$

Pakistan

For year < 1966:

$$\text{AWAGES} = (1 - \text{AGRCPPI}) \times \text{AWAGES}(+1).$$

For year 1985:

$$\text{AWAGES} = -38.9163 + 4.0261 \text{ NNAW} \quad R^2 = 93.35$$

$$(58.5633) \quad (0.2606) \quad n = 19$$

Philippines

For 1963 < Year < 1970:

$$\text{AWAGES} = (1 + \text{AGRCP}) \times \text{AWAGES}(-1).$$

For year 1974:

$$\begin{aligned}\text{AWAGES} &= -41.1658 + 3.2756 \text{ NNAW} & R^2 &= 89.61 \\ &(40.3121) \quad (0.3219) & n &= 14\end{aligned}$$

Portugal

For 1985:

$$\begin{aligned}\text{AWAGES} &= 603.7307 + 59.0354 \text{ NNAW} & R^2 &= 98.25 \\ &(547.5385) \quad (1.8952) & n &= 19\end{aligned}$$

Thailand

Since there were no data on Thailand's agricultural wage but there were for nonagricultural wages, this series was estimated using the following steps:

a. Using the following regression for Philippines:

$$\begin{aligned}\text{NNAW} &= -203.5027 + 0.1060 Y & R^2 &= 46.26 \\ &(0.3994) \quad (0.0381) & n &= 11\end{aligned}$$

b. Using the ratio of Philippines' AWAGES to NNAW (called RWGS),
WAGES for Thailand was defined as AWAGES = RWGS x NNAW of Thailand.

Turkey

For 1975 and 1976:

$$\begin{aligned}\text{AWAGES} &= 329.7506 + 79.9172 \text{ NNAW} & R^2 &= 99.75 \\ &(412.0457) \quad (1.0302) & n &= 17\end{aligned}$$

Zambia

For 1979:

$$\begin{aligned}\text{AWAGES} &= -4.7347 + 0.7468 \text{ NNAW} & R^2 &= 95.77 \\ &(5.7368) \quad (0.0405) & n &= 17\end{aligned}$$

Agricultural Wage Index

AWAGES were converted to dollars at the official exchange rate reported for each country and then indexed (WAGEI) relative to the base year average ratio; that is,

$$\text{WAGEI}_j = \frac{w_j}{w_o} , \quad (7)$$

where j is the country, t is the year, and w is the dollar-denominated wage rate. If q represents the number of workers in agriculture, the base year avarage wage rate was calculated as

$$w_{.o} = \frac{\sum w_{j_o} \cdot q_{j_o}}{\sum_j q_{j_o}} = 66.76 , \quad (8)$$

where 0 is the base year taken to be 1980.

Fertilizer Price Index

The basic data for fertilizer prices paid by farmers are obtained from FAO, in various issues of the *Fertilizer and Production Yearbooks*. The data are also available on tape through the MATRIC ONLINE component of the CARD Information Systems database. The fertilizer price indexes (*FPI*) reported are weighted average prices relative to a base of world average prices for each nutrient in 1984. These indexes were derived as follows.

1. For each country the price per ton of nutrient (N, P₂O₅, and K₂O) of the primary fertilizer materials was converted to U.S. dollars at the current official exchange rate.
2. A world average price for each material for each year was calculated as the simple average of the prices reported in these 18 countries plus the United States.
3. Missing observations on the primary N, P, and K source materials in each country were estimated, with interpolations and extrapolations based on regressions of the available price data on either the relevant U.S. price or world average price, whichever provided a better fit. For scattered years in some countries, the FAO data were augmented with information about prices or price policies from other sources to aid in interpolation.
4. For countries not using the base materials (urea as the base nitrogen source, simple superphosphate as the base phosphate source, and muriate of potash as the base potash source), an estimated price per ton of nutrient in the base material was calculated by multiplying the price for the reported material by the ratio of world average prices of the base material over the reported material.
5. For each country, a Tornquist-Theil price index (base 1984) was calculated using fixed weights (the average share of N, P₂O₅, and K₂O for 1974/75 and 1984/85) and the prices of the nutrients in the base materials as described in step 4.
6. Finally, the index for each country was adjusted to reflect differences in nutrient mix for 1984. Specifically, the index for country j was multiplied by $(1 + \sum_i w_{ij}(\ln P_{ij} - \ln W_i))$, where w_{ij} is the share of nutrient i relative to all nutrients in country j, $\ln P_{ij}$ is the log of the 1984 price for nutrient i in country j, and $\ln W_i$ is the log of the 1984 world average price of nutrient i.

Input Quantities

This section contains a series of tables that list variables representing the quantities of fertilizer consumption, land, labor, and capital.

Fertilizer Consumption

The data on fertilizer (N, P₂O₅, K₂O, TOTAL, and FER), in metric tons of plant nutrients for N, P₂O₅, and K₂O in commercial fertilizers consumed were obtained from the FAO, *Fertilizer Yearbooks*, for various issues (also available through MATRIC ONLINE). Therefore, the four variables under this category are *NITROGEN*, *PHOSPHATE*, *POTASH*, and *TOTAL*. This last variable is the sum of the first three.

FER is defined as total fertilizer utilization in nutrient content equivalent (nitrogen, phosphate, and potash) per hectare of arable and permanent cropland. These data were taken from *World Agricultural Trends and Indicators, 1970-1988* (USDA-ERS 1989).

Land

The four land variables are:

1. *ILAN*, irrigated land, is land area that is purposely provided with water, measured in 1000-hectare units.
2. *CLAN* is the arable and permanent crop land in 1000-hectare units. Arable land includes land under temporary crops, temporary meadows, kitchen and garden land, and land temporarily fallowed. Permanent cropland refers to land that is not planted after each harvest (for example, fruit trees, rubber, and others; excludes land used for timber).
3. *PLAN*, permanent pastures, is land used for permanent forage crops (five or more years), in 1000-hectare units.
4. *TAREA* is total area in the country including bodies of water, in 1000-hectare units.

These data values were collected from the USDA-ERS tape.

Labor and Capital

Labor. There are two variables in this category, *TTLAF* and *TALAF*.

1. *TTLAF* is total labor force in millions of workers, defined as TTLAF = TLAFF x POP, where TLAFF is the percentage of total population employed full time (FAO), and POP is total population in millions of inhabitants (ERS).

2. $TALAF$ is the agricultural labor force in millions of workers, defined as $TALAF = ALAF \times POP$, where $ALAF$ is the percentage of total population that are economically active agricultural laborers (FAO).

These variables are taken from USDA-ERS 1988.

Livestock. The weighted average of various kinds of livestock animals ($TWLVSTK$) on farms is

$$TWLVSTK = \sum_i w_i L_i \quad (9)$$

where w is the weight, L is the number of head, and $i = 1, \dots, n$ = asses to turkeys. The following weights were used: camel, 1.1; buffalo, horses, and mules, 1.0; cattle and asses, 0.8; pigs, 0.2; sheep and goats, 0.1; poultry (chicken, ducks, and turkeys), 0.01 (Hayami and Ruttan 1985).

The original data on numbers of animals were collected from the *FAO Production Yearbook*, various issues, and are available through the Midwest Agribusiness and Trade Research and Information Center's (MATRIC) online computer network.

Machinery. There are two types of machinery measurements ($HPTRACT$, $THPTRACM$) obtained from different sources. First, $HPTRACT$ is horsepower per 1000 hectares of cropland, defined as $HPTRACT = TRTHA \times 30$ hp. The average size of a tractor is assumed to be equivalent to 30 horsepower. $TRTHA$ is the number of tractors per 1000 hectares of cropland. $TRTHA$ are collected from USDA-ERS 1988.

Second, $THPTRACM$ is the horsepower of all tractors including crawler, wheeler, and garden tractors. The original data were collected from *FAO Production Yearbook*, various issues (available through the MATRIC network). Following Hayami and Ruttan (1985), it was assumed that crawler and wheeler tractors will average 30 horsepower per tractor, and garden tractors will average 5 horsepower per tractor. For countries who report the number of garden tractors used (called *garden*), such as Korea, Ghana, Ivory Coast, Sri Lanka, and Turkey, $THPTRACM = (\text{total ag} \times 30) + (\text{garden} \times 5)$, where total ag refers to the sum of crawler and wheeler tractors. Because the *garden* data were not complete, extrapolations were applied as follows:

Ghana (available data 1961-1975)

$$\begin{array}{lll} \underline{\text{Garden}} = -22623.4286 + 11.8036 T & R^2 = 88.44 \\ & (2329.3048) \quad (1.1836) \end{array}$$

where T is Time

Ivory Coast (available data 1961-1973)

$$\underline{\text{Garden}} = -8744.1524 + 4.4607 T \quad R^2 = 78.28$$

(1282.6923) (0.6518)

where T is Time

Sri Lanka (available data 1961-1976)

$$\underline{\text{Garden}} = -59915.9515 + 30.5103 T \quad R^2 = 82.13$$

(7486.7931) (3.8033)

where T is Time

Input Quality

Two groups representing measures of quality are labor quality and land quality.

Labor Quality

There are three measures of labor quality: School Enrollment Ratio, Adult Literacy Rate, and Life Expectancy.

School Enrollment Ratio. The first variable in this ratio is *AGER1MF*, defined as gross enrollment of all ages at the primary level as a percentage of children in the country's school age group (World Bank 1987). For some countries with universal primary education, the gross enrollment may exceed 100 percent because some pupils are younger or older than the country's standard primary school age (6 to 11 years).

The second variable is *AGER2MF*, defined as gross enrollment of all ages in secondary school, including pupils enrolled in vocational, or teacher training, secondary school as a percentage of teenagers in the country's school age group. The definition of secondary school age differs among countries, but the common ages are 12 to 17.

Both variables were completed by regressing each variable on the time variable and were collected from World Bank 1987.

Adult Literacy Rate. *ALR* is the number of adults with the ability to both read and write, and is expressed as a percentage of the adult population 15 years and older. These values were obtained from World Bank 1987.

Life Expectancy. *POPLIFE* is defined as the number of years a newborn infant would live if prevailing patterns of mortality for all people at the time of his or her birth were to stay the same throughout his or her life. This variable was also obtained from the World Bank 1987 Tables.

Land Quality

Land quality is measured by five indices (*WPDM*, *WFWD*, *WDCC*, *WMPDMI*, *LQIND*), each with a single value across time for each country. The first four land quality indices were taken from Linneman 1979. *WPDM* is the weighted potential production of dry matter, where the potential production of dry matter (*PDM*) is in 100 kilograms per hectares per year. *WFWD* is the weighted factor for water deficiency, where the factor for water deficiency (*FWD*) is the ratio between the actual and potential transpiration. *WDCC* is the weighted development cost classed as an indicator of the capital inputs required. *WMPDMI* is the weighted maximum production of dry matter, including that produced for irrigated land. For nonirrigated land, *WMPDMI* equals *WMPDM* (maximum production of dry matter). This variable is in million tons per year.

The values of *PDM*, *DCC*, *FWD*, and *MPDMI* were taken from *MOIRA: Model of International Relations in Agriculture* (Linneman et al. 1979). Weights were the percentage values of each soil type for each country.

Finally, *LQIND* is the international land quality index for all agricultural land, constructed by Peterson (1987) as an attempt to provide a superior alternative to the "simple measure of land." This index for a specific nation is determined by the antilog of the *LPV*, the log of the predicted per acre value of agricultural land, of that nation divided by the average of these transformed *LPVs* for 126 nations, and then multiplied by 100. For example, the land quality index of country *i* is

$$LQIND = \frac{\exp LPV_i}{\frac{1}{126} \sum_{j=1}^{126} \exp LPV_j} \cdot 100 . \quad (10)$$

The *LPV* was given by Peterson 1987:

$$LPV = 0.0077 PNCL + 0.0133 PIL + 0.4161 LP$$

where *PNCL* is nonirrigated crop land in each state as a percentage of all crop land plus land in farms designated as permanent pasture, *PIL* is irrigated land as a percentage of all cropland in farms, and *LP* is the log of long-run average annual precipitation. Data on *LQIND* were taken from *International Land Quality Indices* (Peterson 1987).

Research Stock and Infrastructure

The following four variables are measures of research stock and infrastructure. The first two, *APERSON* and *AEXPEND*, are measures of agricultural research activities financed and/or executed by the public sector, and include private nonprofit agricultural research. However, private and/or for-profit agricultural research are excluded.

Agricultural Research Personnel

APERSON is the total number of research personnel "who engaged directly in the conception or creation of new knowledge, products, processes, methods and systems, excluding technicians and support and clerical staff who normally perform scientific and technical tasks under the supervision of a scientist." This variable is measured in scientist man-years (SMY) or manpower (Pardey and Roseboom 1989). Educational levels rather than occupational classes are used to distinguish scientific from nonscientific staff.

The original data for the 1960s were obtained primarily from Boyce and Evenson (1983). The data series from Pardey and Roseboom (1989) were used as complementary.

Missing observations were generated using the following procedures:

1. Estimating the missing observations that are bounded by the years with observations, as follows:

- a. One year missing: Given the values for 1963 and 1965,

$$EST.APERSON_{1964} = (1/2)(APERSON_{1963} + APERSON_{1965}) \quad (11)$$

where *EST.* = estimate.

- b. Two years missing: Given the values for 1962 and 1965, calculate the average growth rate = *w*:

$$w = \left(\frac{1}{3}\right) \cdot \frac{(APERSON_{1965} - APERSON_{1962})}{APERSON_{1962}} \quad (12)$$

and the estimates for 1963 and 1964 are

$$EST.APERSON_{1963} = (1 + w) \cdot APERSON_{1962}, \quad (13)$$

$$EST.APERSON_{1964} = (1 - w) \cdot APERSON_{1965}. \quad (14)$$

- c. Three years missing: The estimates are calculated by using the two previous methods where (b) has to be done before (a). For example, given data for 1971 and 1975, the

average annual growth rate and method (b) are used to calculate the estimates for 1972 and 1974. Then, by using method (a), the estimate for 1973 was the average of 1972 and 1974.

- d. Four years missing: The estimates are calculated sequentially by using method (b) twice.
- e. Five years missing: The estimates are calculated by combining (d) and (a).
- 2. Estimating the missing starting and ending observations: Using the whole series, regress the series on a trend and estimate the missing observations. If the estimated values are not as expected, that is, negative or much lower or bigger than the series, extrapolation of the growth rates of the five years closest to the missing observations is used.

These regressions were performed:

Brazil

$$\begin{array}{lll} \underline{\text{APERSON}} = 42.8542 + 158.2298 T & R^2 = 97.94 \\ (183.7178) \quad (5.4175) & n = 24 \end{array}$$

Chile

$$\begin{array}{lll} \underline{\text{APERSON}} = 120.6085 + 7.4045 T & R^2 = 92.27 \\ (14.2639) \quad (0.4793) & n = 22 \end{array}$$

Korea

$$\begin{array}{lll} \underline{\text{APERSON}} = 420.8019 + 38.9149 T & R^2 = 91.24 \\ (76.7459) \quad (2.7657) & n = 21 \end{array}$$

Morocco

$$\begin{array}{lll} \underline{\text{APERSON}} = 72.1481 + 5.6115 T & R^2 = 59.98 \\ (33.1416) \quad (0.9773) & n = 24 \end{array}$$

Zambia

$$\begin{array}{lll} \underline{\text{APERSON}} = 8.7448 + 4.3411 T & R^2 = 79.28 \\ (16.0433) \quad (0.4731) & n = 24 \end{array}$$

Agricultural Research Expenditure

AEXPEND is actual research expenditures, including salaries and operating and capital expenses that are measured in constant 1980 U.S. dollars using purchasing power parity (PPP). PPP is defined as "a measurement of the domestic cost of buying a bundle of goods and services in a particular country as its own price relative to the corresponding cost, say, in dollars of the same bundle in the United States" (Pardey and Roseboom 1989).

The data series were collected from the same sources as the agricultural research personnel variable. The same procedure was also applied to generate missing observations for this variable. The following regressions were performed:

Brazil

$$\begin{array}{lll} \underline{\text{AEXPEND}} = -62.3572 + 17.7679 T & R^2 = 83.22 \\ (53.0881) \quad (1.7840) & n = 22 \end{array}$$

Chile

$$\begin{array}{lll} \underline{\text{AEXPEND}} = 13.2770 + 0.7008 T & R^2 = 55.03 \\ (4.2156) \quad (0.1417) & n = 22 \end{array}$$

Colombia

$$\begin{array}{lll} \underline{\text{AEXPEND}} = 27.4236 + 0.8614 T & R^2 = 23.03 \\ (8.2125) \quad (0.1417) & n = 17 \end{array}$$

Dominican Republic

$$\begin{array}{lll} \underline{\text{AEXPEND}} = 0.0166 + 0.1963 T & R^2 = 76.05 \\ (0.7646) \quad (0.0240) & n = 23 \end{array}$$

Egypt

$$\begin{array}{lll} \underline{\text{AEXPEND}} = 14.1245 + 0.9749 T & R^2 = 82.63 \\ (3.2322) \quad (0.0953) & n = 24 \end{array}$$

Gross Domestic Product for Transportation and Communication

These time-series data (*AGDPTC*) are a measure of infrastructure that are defined and completed as follows. *AGDPTC* comprises "compensation of employees, operating surplus and provision for the consumption of fixed capital" (World Bank 1984). This variable is measured at current factor cost. While the data for Morocco were collected from the *Annual Statistics of the United Nations*, the data for other countries were collected from *World Tables 1984* and *World Tables 1976*.

Two primary procedures were used to estimate the missing observations.

Missing values that lie between two known values, $t - n$ and $t + n$. For some countries, like Ghana, the missing data for 1961-64 were completed by using the average annual growth rate given the values in 1960 and 1965. However, for other countries, the annual growth rate from the time series in *World Tables 1976* was used to complete the data series.

Missing values at the beginning or the end of the series. Given the time-series data of Gross Domestic Product for Services (*GDPS*) in *World Tables 1987*, the percentage values of *GDPTC* over *GDPS* (%*AGDPTC*) could be found. These percentage values were regressed on Time (*T*) and used

to estimate the percentage values for years for which *GDPTC* data were missing. This was true for Morocco before 1970 and for other countries in 1982 and 1983. These estimated percentages were multiplied by GDPS values in order to get the estimates for the *GDPTC* (*AGDPTC*).

The exception was made for Portugal, which did not have a GDPS time series. The estimates were calculated from a regression analysis of *GDPTC* on Time (*T*). The regressions are:

Argentina

$$\begin{aligned} \underline{\%AGDPTC} &= 4.7214 - 0.0023 T & R^2 &= 29.73 \\ &(0.0163) (0.0009) & n &= 15 \end{aligned}$$

Brazil

$$\begin{aligned} \underline{\%AGDPTC} &= 1.9891 - 0.0009 T & R^2 &= 57.91 \\ &(0.0038) (0.0002) & n &= 15 \end{aligned}$$

Chile

$$\begin{aligned} \underline{\%AGDPTC} &= 0.7176 - 0.0003 T & R^2 &= 1.99 \\ &(0.0108) (0.0006) & n &= 16 \end{aligned}$$

Colombia

$$\begin{aligned} \underline{\%AGDPTC} &= -0.5705 + 0.0004 T & R^2 &= 57.91 \\ &(0.0058) (0.0003) & n &= 16 \end{aligned}$$

Dominican Republic

$$\begin{aligned} \underline{\%AGDPTC} &= 3.3009 - 0.0016 T & R^2 &= 27.67 \\ &(0.0120) (0.0007) & n &= 15 \end{aligned}$$

Egypt

$$\begin{aligned} \underline{\%AGDPTC} &= -31.2116 + 0.0159 T & R^2 &= 95.62 \\ &(0.0080) (0.0015) & n &= 7 \end{aligned}$$

Ghana

$$\begin{aligned} \underline{\%AGDPTC} &= 3.9311 - 0.0019 T & R^2 &= 22.71 \\ &(0.0176) (0.0009) & n &= 16 \end{aligned}$$

Ivory Coast

$$\begin{aligned} \underline{\%AGDPTC} &= -11.8707 - 0.0006 T & R^2 &= 78.69 \\ &(0.0151) (0.0008) & n &= 16 \end{aligned}$$

Korea, Rep. of

$$\begin{aligned} \underline{\%AGDPTC} &= -0.0434 + 0.0001 T & R^2 &= 2.92 \\ &(0.0084) (0.0005) & n &= 16 \end{aligned}$$

Malaysia

$$\begin{aligned} \underline{\%AGDPTC} &= -6.6846 + 0.0035 T & R^2 &= 83.29 \\ &(0.0072) (0.0004) & n &= 15 \end{aligned}$$

$$(0.0095) \quad (0.0005) \quad n = 16$$

Zambia

$$\underline{\%AGDPTC} = 0.1698 - 0.000001 T \quad R^2 = 0.004$$

$$(0.0149) \quad (0.0008) \quad n = 16$$

Road Density

In addition to *AGDPTC* as a measure of infrastructure, *ROADDEN* is the density of the total network measured in kilometers per square kilometer and obtained from the International Road Federation (IRF), *World Road Statistics 1978-1982* and *1980-1984*. The data available were for 1978 and 1980-84.
