Ethanol-Livestock Synergies

A 50-Million Gallon Ethanol Plant ...

- Uses roughly 18.5 million bushels of corn
 - In Iowa, corn from 116,000 acres
- Produces 315 million pounds of distillers grains
 - This could feed approx. 60,000 dairy cattle
- Utilizes natural gas in plant operations
 - Manure from 60,000 dairy cattle could produce enough methane to meet 25 percent of the ethanol plant's needs

The 2 Keys to the Food-Fuel Debate

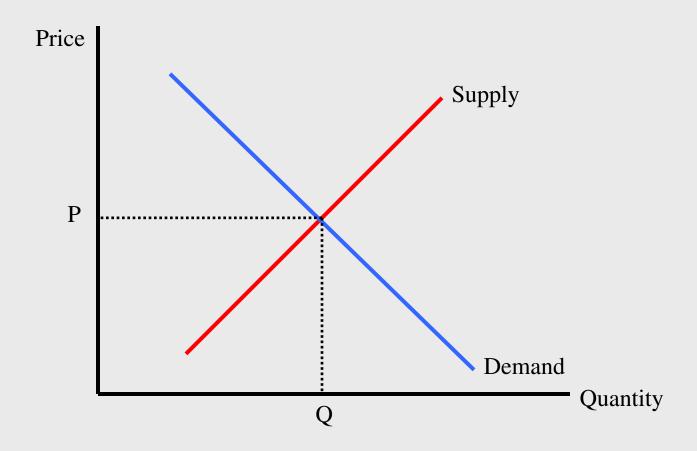

• The ability of U.S. corn production to match demands from ethanol, livestock, and exports

• The ability of U.S. livestock to utilize ethanol co-products as a partial substitute for corn in feed rations

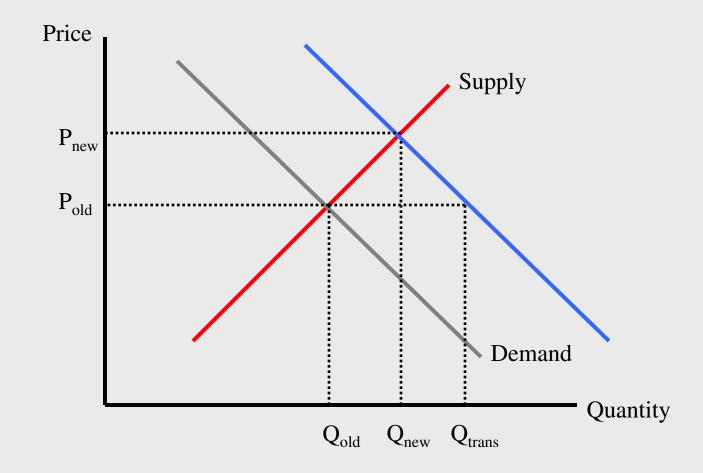

An Exploratory Look at the Food-Fuel Debate

The Corn Market before the Introduction of a new Ethanol Plant

The New Plant Shifts Corn Demand

Projection Scenario

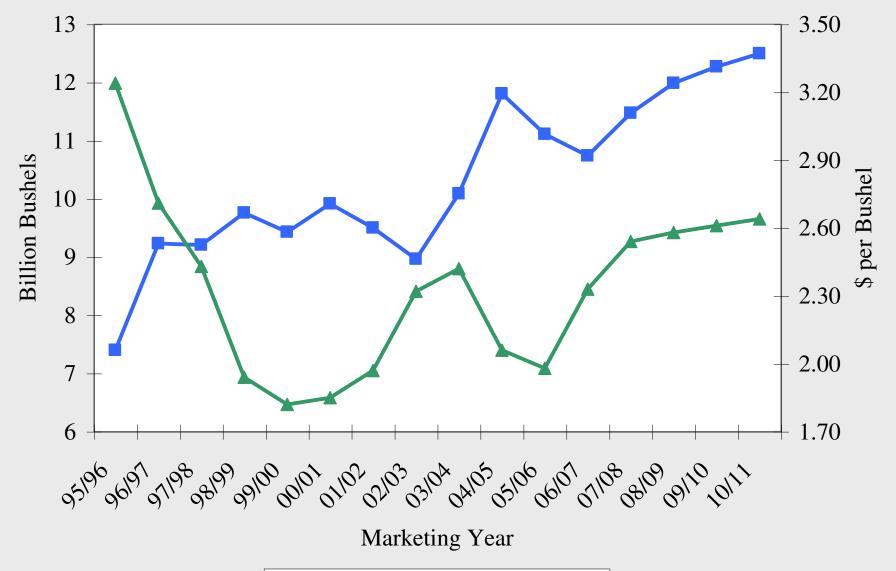

- Look at possible effects from a doubling of U.S. ethanol production from 2005 to 2009
 - Source: FAPRI July 2006 Baseline Update

Impacts both crop and livestock markets

 Higher corn prices may not make the U.S. livestock industry less competitive in world markets

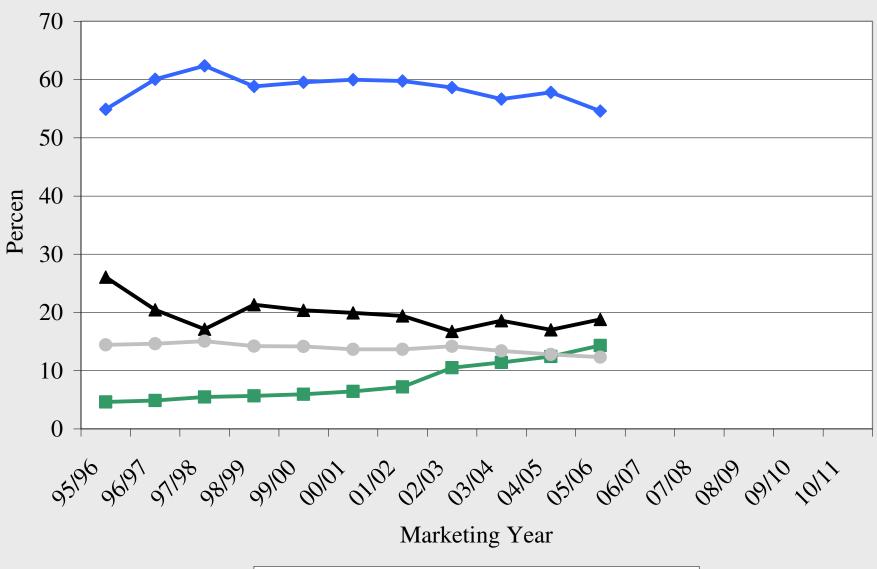

Corn Production and Prices

Historical Corn Utilization

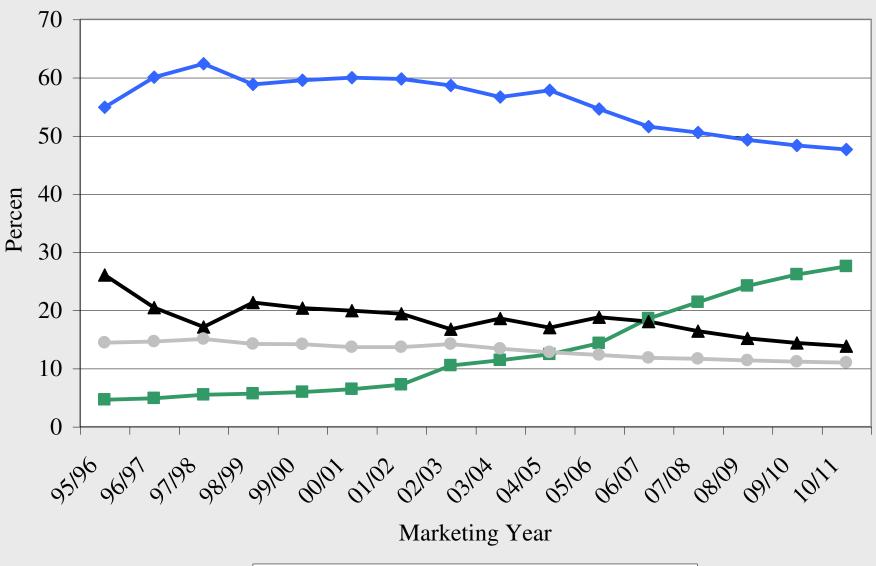

Projected Corn Utilization

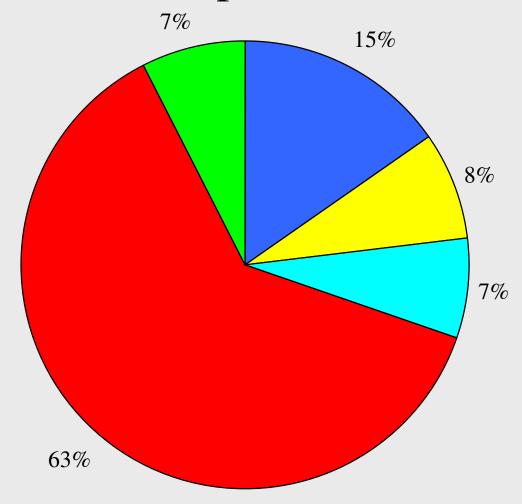

World Corn Exports in 2005/2006

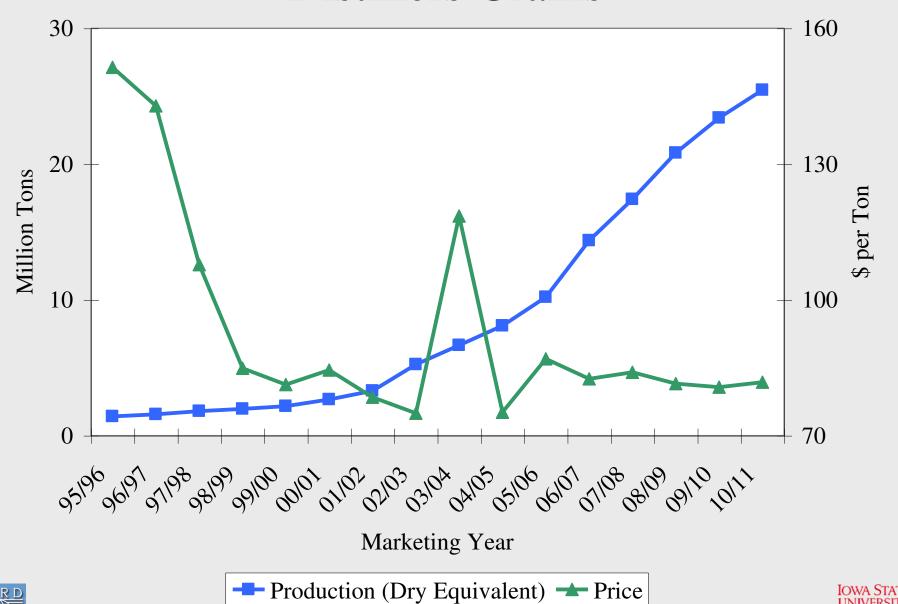

So With a Doubling of Ethanol Production...

- Corn prices rise
- U.S. corn feed and export demand falls on a percentage basis
- But the U.S. is still the largest exporter of corn and the U.S. corn price is the benchmark world corn price
- Livestock producers throughout the world feel the impact of higher U.S. corn prices

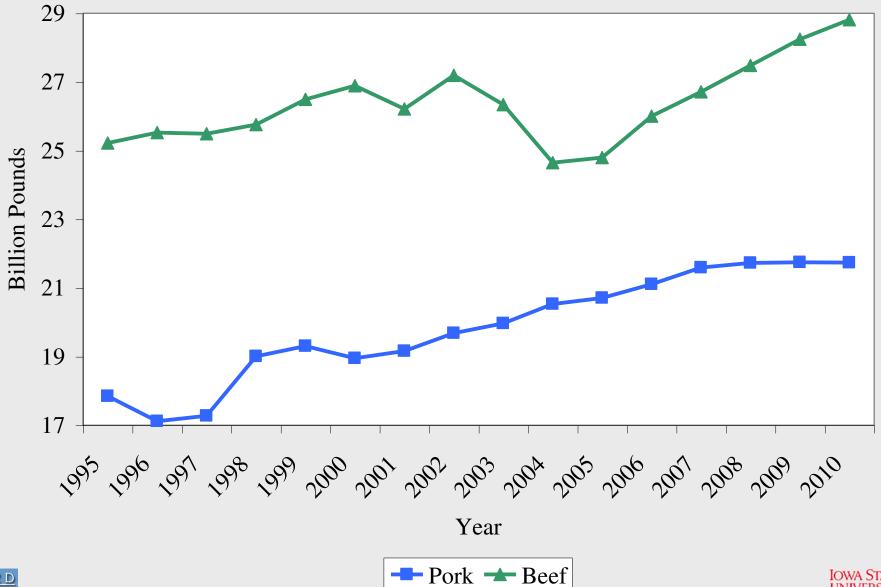

Distillers Grains

U.S. Meat Production

Some Summary Thoughts

- The doubling of U.S. ethanol production by 2009 is likely a conservative scenario given the current pace of investment in the industry
 - In Iowa, announced expansions and new construction of ethanol plants will more than double capacity

- Livestock impacts will depend on the ability of species to adapt to ethanol co-products
 - Cattle have an advantage over hogs and poultry?

Some Summary Thoughts

- Corn production shortfalls will pressure both the ethanol and livestock industries
 - Could squeeze the corn export market and affect the competitiveness of the U.S. pork and poultry exports

- Ethanol's corn demand is linked with energy prices and government policy; Livestock's corn demand is linked with meat prices
 - Currently, corn is worth more as ethanol than as feed

Some Summary Thoughts

• CARD researchers are continuing to explore the connection among the crop, livestock, and ethanol markets
