U.S. Ethanol Industry Outlook: 
Socio/Economic Impact of Booming 
Ethanol Industry 

Bruce A. Babcock 
Center for Agricultural and Rural Development 
Iowa State University 

Presented at the ProBeef 07 
Ames, Iowa September 5, 2007
Overview

• Review where we are with ethanol and where we are going under current policies and oil prices

• What would happen if oil prices rise?

• What would happen if drought hit the U.S. Corn Belt?
• Current ethanol capacity: 6.5 billion gallons/year
• Total capacity under construction and expansion: 6.5 billion gallons/year
• 77 new ethanol plants and 8 expansion projects underway
• 2.2 billion bushels of corn were used in producing fuel ethanol in 2006/2007 marketing year.
• 3.2 billion bushels of corn are expected to be used in producing fuel ethanol for 2007/2008 marketing year.
• At 13 billion gallons, corn use = 4.7 billion bushels = 30 million acres
• Current capacity: 1.2 billion gallons/year
• Total capacity under construction and expansion: 0.7 billion gallons/year
• Carriquiry calculates that sales were less than 300 million gallons in 2006
• FAPRI also projects less than 30% capacity utilization because of low or negative operating margins
Projected U.S. Ethanol Production

billion gallons

- 2006: 5 billion gallons
- 2008: 10 billion gallons
- 2010: 14 billion gallons
- 2012: 16 billion gallons
- 2014: 16 billion gallons
- 2016: 16 billion gallons

Corn Wheat Soybeans
Importance of Margin

• Without prospect of a positive margin, ethanol plants will not get built
• With plants operating at full capacity there is a corn price that shuts down ethanol plants, freeing up corn to feed livestock
• If there is excess capacity, there is a corn price that will cause plants to run at full capacity
• Both floor and ceiling prices are determined by price of gasoline.
Dry Mill Ethanol Plant Operating Margins at Different Corn Prices with $2.00 Gasoline ($1.84 Ethanol)

Plant will shut-down

Plant will operate

Wholesale Price of Gasoline
Dry Mill Ethanol Plant Operating Margins at Different Corn and Gasoline Prices
Three Scenarios

1. Price of gasoline falls to $1.00/gallon after 14 billion gallons of ethanol capacity is built
   - Price of corn will be bid up to $2.50 per bushel
2. Price of gasoline remains at $2.00/gallon, 35 million acres needed to run ethanol plants
   - Price of corn will be above $3.30/bu, but will not rise above $4.75/bu even under short crop conditions
3. Price of gasoline rises to $2.25 per gallon because crude oil prices increase $10 above baseline levels
Impact of Higher Crude Oil Price

- Increased crude oil price by $10/barrel over the projection
- Margins on ethanol plants increase
- New incentive to invest in added capacity for ethanol production
- Eventually, a new equilibrium reached where there is no incentive to invest in or exit the ethanol industry
- Will demand for ethanol be enough?
  - E-10 market will saturate around 15 billion gallons
  - Drop in ethanol price relative to gasoline will eventually encourage increase in demand for the flex-fuel cars

Impact on Rest of the World

- World grain and oilseed prices increase
- Result in higher feed and food prices
- Higher food prices
- Higher livestock production cost
- Countries in South America and Asia fill the gap
Impact of Short Crop Scenario

• Drought in 2012 similar to 1988
  – Regional yields of corn, soybeans and wheat changed from trend levels
  – Yields were off by 25% for corn, 18% for soybeans, and 11% for wheat in 1988

• Ethanol mandate for 2012 assumed to be 14.7 billion gallons
Corn, Soybean and Ethanol Markets

- Corn price increases by 44% above baseline levels
- Soybean price rises by 22%
- Corn exports and stock levels decline by more than 60%
- Corn exports from South America, China, etc. fill part of the gap from decline in U.S. corn exports
- Corn feed use declines by 16% (switch to other feeds)
- Ethanol trade increases moderately
Livestock Market

• Higher feed costs affect the livestock sector but to a lesser extent as shock is perceived as temporary
  – Production declines
    • Broiler production declines the most (over 2.5%)
    • Milk production declines the least (0.5%)
  – Retail prices increase
    • Egg prices increase the most (about 5.5%)
    • Prices of other products increase by a range between 2% and 4%
Conclusions

• U.S. biofuels policy choices combined with the price of crude oil will determine future feed prices
• Food prices primarily determined by factors other than the price of feed
• Cellulosic ethanol will not replace corn-based ethanol without a change in policy incentives
